JOBS LOST, JOBS GAINED: WORKFORCE TRANSITIONS IN A TIME OF AUTOMATION

DECEMBER 2017

Mexico

Mexico has a young population and a growing workforce. Mid- to low-wage levels may slow automation adoption, while comparatively low GDP growth may temper growth in labor demand. The step-up scenario will create enough labor demand to offset the effects of both automation and demographics.

Economics and demographic context

Demographics

6% over 65 years of age in today's population, and growing to 10% by 2030

Economic development

1.3% GDP per capita growth, annualized 2016–30

Wages

\$9,000
average annual wage

Automation potential

13% of current work activity hours automated by 2030
in the midpoint scenario, and up to 26% in the rapid scenario

MCKINSEY GLOBAL INSTITUTE

JOBS LOST, JOBS GAINED: WORKFORCE TRANSITIONS IN A TIME OF AUTOMATION

DECEMBER 2017

Jobs lost, jobs gained

Net change in jobs by 2030 (Million)

Enough jobs are created in the **step-up scenario** to offset automation and the growth in labor force, given innovation in new work activities

- A** 2016 baseline
- B** Jobs displaced by automation by 2030 in the midpoint scenario
- C** Jobs displaced by automation by 2030 in the rapid scenario
- D** Jobs created by 2030 in the trendline scenario
- E** Jobs created by 2030 in the step-up scenario
- F** New occupations and unsized labor demand¹
- G** Change in labor force by 2030

Growth/decline of occupation types by 2030

Occupation type <i>Examples</i>	Net change in jobs (midpoint automation, step-up scenario) ² Million	% of jobs	
		2016	2030
Customer interaction <i>Retail sales, bartenders</i>	2.7	35	34
Builders <i>Construction workers, electricians</i>	1.7	7	8
Other jobs, predictable environments <i>Machinists, cooks</i>	1.7	25	24
Care providers <i>Surgeons, nurses</i>	1.6	4	5
Other jobs, unpredictable environments <i>Farmworkers, firefighters</i>	0.8	16	15
Office support <i>Payroll clerks, data entry</i>	0.7	6	6
Professionals <i>Lawyers, business specialists</i>	0.4	3	3
Managers and executives <i>CEOs, sales managers</i>	0.4	3	3
Educators <i>Teachers, librarians</i>	0.2	1	1
Technology professionals <i>Web developers, IT</i>	0.1	1	1
Creatives <i>Authors, designers</i>	0.1	0	0

A Modern Example

As an example of how nonpatentable math becomes patentable, consider patent 6,735,568 (granted to Eharmony.com on May 11, 2004) for a “Method and system for identifying people who are likely to have a successful relationship.” Despite a bit of window dressing about neural networks and verifying the results by running regressions on past matches, the gist of the process as claimed is this:

1. Ask candidates to fill out a survey.
2. Enter the data into a matrix.
3. Run a singular value decomposition (SVD) of the matrix to find the candidates’ positions in an imaginary space.
4. Match candidates who are closest in the imaginary space.

Steps 1 and 2 are trivial, and given the positions calculated in step 3, step 4 is also easy (this is no traveling salesman problem!). All of the magic happens in step 3 (claim 11 of the patent). The mathematician readers will recognize the SVD (also known as principal component analysis, or factor analysis) as a standard method used in linear algebra to reduce data in many dimensions to fewer dimensions with a minimal loss of information (that is, a method for low-rank approximation). Social scientists will recognize it as a commonly used method of categorizing people; for example, political scientists use it to categorize members of Congress by their roll call votes, and anthropologists use it to determine whether people from different cultures perceive common stimuli such as colors differently.²⁸ Computer scientists are reminded that they just need to find the right library: for this the author suggests the GNU Scientific Library, whose `gs1_linalg_SV_decomp` function will do the entire SVD with one function call.

In short, Eharmony has taken a mathematical procedure from undergraduate linear algebra textbooks and applied it to a slightly novel setting by assigning names to the variables, calling L_1 , for example, sexual passion and L_2 , spirituality. The additional mathematical window dressing in

The technology

Scope of Experience

- 3** PHD Level Computer Science
- 2** PHD Level Robotics
- 2** Master Degree in Artificial Intelligence
- 10** Master Degree in Computer Science, Math & Physics
- 30+** Team of Data Scientists, Data Engineers, Data Science Executives
- 200+** Projects with some element of AI embedded

-  Data classification (Bayes Network, Decision Tree, etc.)
-  Data Clustering (Data Segmentation)
-  Machine Learning, Deep Learning & Predictive Analytics
-  Natural Language Processing (Translation, extraction & classification)
-  Vision (Pattern Recognition & Machine Vision)
-  Regression (Linear Regression, ANN, Genetic Algorithm, Monte Carlo Method)
-  Data Mining (K-means)

-  Education
-  Logistics
-  Health
-  Maritime
-  Agro-business
-  Energy

As long as there is valuable data, we can extract high level applicable knowledge

	Agroindustry:	Logistic:	Education:	Agroindustry:	Energy:
	Cattle Estimation	Driver behavior	School violence	Drone Images	Simulation Core
Business Problem	Optimize the production of milk and beef.	Reduce fuel costs and extend vehicle lifetime of the company fleet.	Early detection of school violence based of enviromental factors.	Assess the status of plants in large fields in hard to reach areas.	Gain experience designing the water infrastructure needed around an oil extraction zone.
AI Element	Scientific model Machine learning Database pre-processing	Signal processing Event detection Time analysis Bayesian network	Clustering Graph theory	Image processing Pattern recognition	Path finding Multithreading
Solution	Desktop app to make an estimation of the genetic value of the cattle using the family history.	Mobile app the records the behavior of the driver during trips using integrated sensors, recording potential risk conducts.	App that uses information of the area around the school to assess negative influence areas and gives the location a risk score.	Using an hyperspectral camera, plants area automatically detected and information regarding of their health and status are obtained.	Desktop app that loads the disposition of the extraction zones, and both the water sources and treatment centers. With option for manually drawn pipelines and tank trucks with automatic path finding. All the physical models are multithreaded and coordinated by the core of the simulator.

	Health: Glucose Monitoring	Health: Cancer Risk Detection	Logistics: Simulation	Logistics: Scheduler Optimization	Logistics: Stock Optimization
Business Problem	A prompt response to an emergency requires accurate and prompt data. People of interest should be constantly aware of the condition of their loved ones.	Survival rates depend on detecting cancer on early stages. Access to high level laboratories for image analysis should be available widely.	How to rate level of risk based on political, technological and weather related variables	How to rate level of risk based on political, technological and weather related variables	Optimize stock levels of spare parts based on historic information about previous purchases adding other related variables as weather, geographic characteristics, road conditions
AI Element	Complex Pattern Recognition Machine Learning	Machine learning Pre-processing of images Complex pattern recognition	Bayes Network	Mathematical optimization and metaheuristics	Machine Learning (Supervised learning & ANN)
Solution	Mobile app able to recognize blood sugar metrics taken by any commercial glucose monitoring device and send to interested recipients for applicable response	Mobile app able to analyze cervix images to immediately determine level of risk for prompt response	Design of Bayes network to rate level of risk for 3 levels	Design of Bayes network to rate level of risk for 3 levels	Design web system that forecast optimum purchase levels for next periods

IA2030Mx

FORTALECEMOS EL ECOSISTEMA Y
DESARROLLAMOS UNA AGENDA
DE INTELIGENCIA ARTIFICIAL PARA MÉXICO.

<https://www.ia2030.mx/>

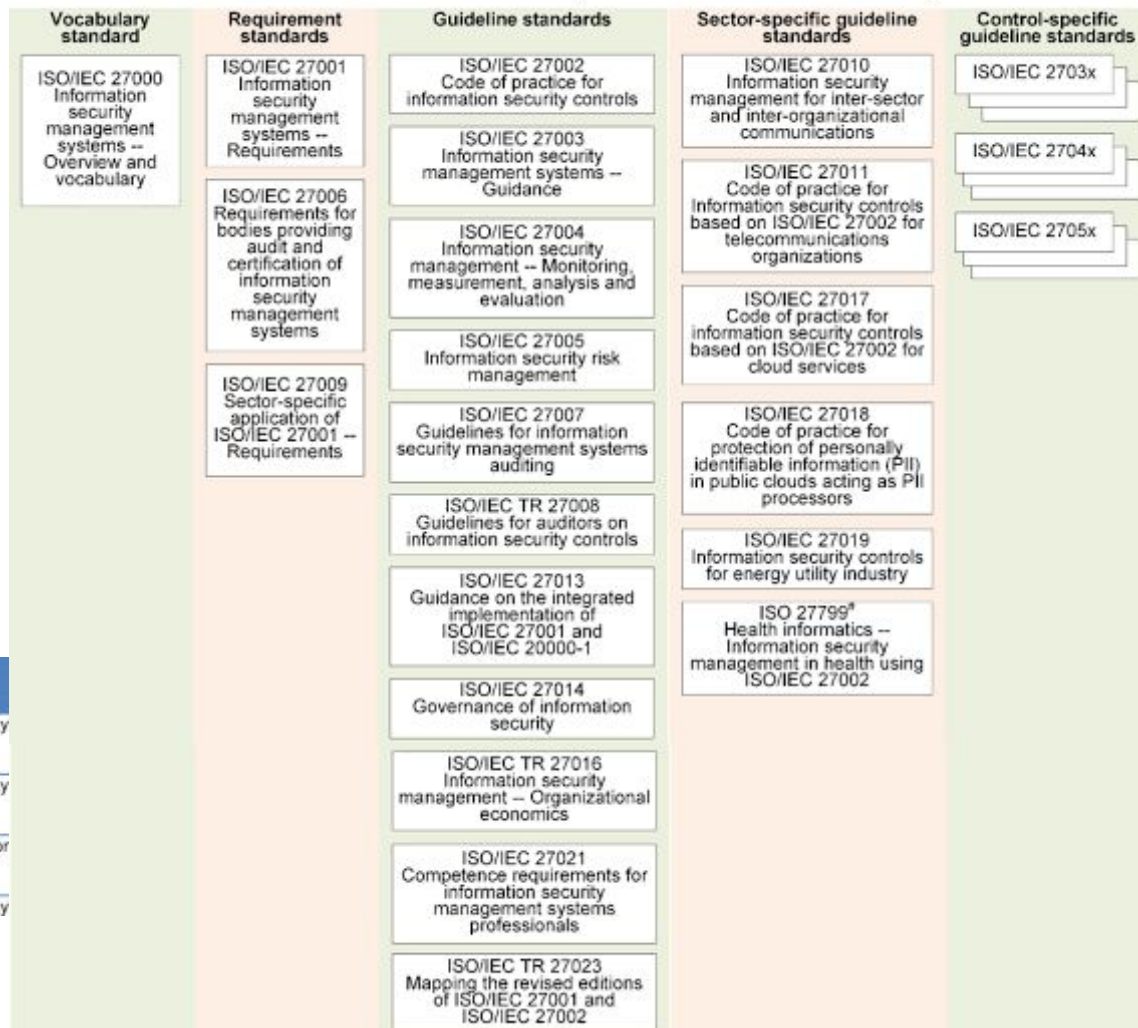

Plan de hoy

- 1) Breve update y referencias
- 2) El caso de CHINA en IA
- 3) México en el contexto de IA y negocios
- 4) La Ciencia de los Datos y la IA**
- 5) Escenarios actuales ante COVID-19
- 6) PANARQUÍA
- 7) ¿ Qué podemos hacer ?

Published Standards	Year Published	Title of Standard

Table 1.3 Examples of Data Mining and Machine Learning for Anomaly Detection

<i>Technique Used</i>	<i>Input Data Format</i>	<i>Levels</i>	<i>References</i>
C.1 Statistical methods	Sequences of system calls, offline	Host	Ye et al. (2001), Feinstein et al. (2003), Smaha (1988), Ye et al. (2002)
C.2 Statistical methods	TCP/IP data, online	Network	Yamanishi and Takeuchi (2001), Yamanishi et al. (2000), Mahoney and Chan (2002, 2003), Soule et al. (2005)
C.3 Unsupervised clustering algorithm	TCP/IP data, offline	Network	Portnoy et al. (2001), Leung and Leckie (2005), Warrender et al. (1999), Zhang and Zulkernine (2006a,b)
C.4 Subspace	TCP/IP data offline	Network	Li et al. (2006)
C.5 Information theoretic	TCP/IP, online	Network	Lakhina et al. (2005)
C.6 Association rules	Frequency of system calls, online	Host	Lee and Stolfo (1998), Abraham et al. (2007a,b), Su et al. (2009), Lee et al. (1999)
C.7 Kalman filter	TCP/IP data, online	Network	Soule et al. (2005)
C.8 Hidden Markov model (HMM)	Sequences of system calls, offline	Host	Warrender et al. (1999)
C.9 ANN	Sequences of system calls, offline	Host	Ghosh et al. (1998, 1999), Liu et al. (2002)
C.10 Principal component analysis (PCA)	TCP/IP data, online	Network	Lakhina et al. (2004), Ringberg et al. (2007)
C.11 KNN	Frequency of system calls, offline	Host	Liao and Vemuri (2002)
C.12 SVM	TCP/IP data, offline	Network	Hu et al. (2003), Chen et al. (2005)

Table 1.2 Examples of Data Mining and Machine Learning for Misuse/Signature Detection

<i>Technique Used</i>	<i>Input Data Format</i>	<i>Levels</i>	<i>References</i>
B.1 Rule-based signature analysis	Frequency of system calls, off line	Host	Lee et al. (1999)
B.2 ANN	TCP/IP data, offline	Host	Ghosh and Schwartzbard (1999), Cannady (1998)
B.3 Fuzzy association rules	Frequency of system calls, online	Host	Abraham et al. (2007b), Su et al. (2009)
B.4 SVM	TCP/IP data, offline	Network	Mukkamala and Sung (2003)
B.5 Linear genetic programs (LGP)	TCP/IP data, offline	Network	Mukkamala and Sung (2003), Abraham et al. (2007a,b), Srinivas et al. (2004)
B.6 Classification and regression trees	Frequency of system calls, offline	Host	Chebrolu et al. (2005)
B.7 Decision tree	TCP/IP data, online	Network	Kruegel and Toth (2003)
B.8 BN	Frequency of system calls, offline	Host	Chebrolu et al. (2005)
B.9 Statistical method	Executables, offline	Host	Schultz et al. (2001)

Table 1.4 Examples of Data Mining for Hybrid Intrusion Detection

<i>Technique Used</i>	<i>Input Data Format</i>	<i>Levels</i>	<i>References</i>
D.1 Correlation	TCP/IP data, online	Network	Ning et al. (2004), Cuppens and Miège (2002), Dain and Cunningham (2001a,b)
D.2 Statistical methods	Sequences of system calls, offline	Host	Endler (1998)
D.3 ANN	Sequences of system calls, offline	Host	Endler (1998)
D.4 Association rules	Frequency of system calls, online	Host	Lee and Stolfo (2000)
D.5 ANN	TCP/IP data, online	Network	Ghosh et al. (1999)
D.6 Random forest	TCP/IP data, online	Network	Zhang and Zulkernine (2006a,b)

Table 1.5 Examples of Data Mining for Scan Detection

<i>Technique Used</i>	<i>Granularity</i>	<i>Levels</i>	<i>References</i>
E.1 Statistical methods	Batch	Both	Staniford et al. (2002a,b)
E.2 Rule-based	Batch	Both	Staniford-Chen et al. (1996)
E.3 Threshold random walk	Continues	Host	Jung et al. (2004)
E.4 Expert knowledge—rule based	Batch	Network	Simon et al. (2006)
E.5 Associative memory	Continuous	Network	Muelder et al. (2007)

Table 1.6 Examples of Data Mining for Profiling

<i>Technique Used</i>	<i>Input Data Format</i>	<i>Levels</i>	<i>References</i>
F.1 Association rules	Set of network flow, offline	Network	Apiletti et al. (2008)
F.2 Shared nearest neighbor clustering (SNN)	Set of network flow, offline	Network	Ertöz et al. (2003), Chandola et al. (2006)
F.3 EM-based clustering	Set of network flow, offline	Network	Patcha and Park (2007)
F.4 Subspace	Set of network flow, offline	Network	Lakhina et al. (2004), Erman et al. (2006)
F.5 Information theoretic	Set of network flow, offline	Network	Xu et al. (2008)

01

BUSINESS UNDERSTANDING

Ask relevant questions and define objectives for the problem that needs to be tackled.

07

VISUALIZATION

02

DATA MIN

Questions and define
the problem that
be tackled.

02

DATA MINING

Gather and scrape the
data necessary for the
project.

SCIENCE

SCIENCE CYCLE

p.co

03

DATA CLEANING

Fix the inconsistencies
within the data and
handle the missing
values.

04

05

FEATURE ENGINEERING

Identify important features and make them more meaningful from the raw data that you have.

04

DATA EXPLORATION

Form hypotheses about your defined problem by visually analyzing the data.

DATA CLEANING
Fix the inconsistencies within the data and handle the missing values.

Train machine learning models, evaluate their performance, and use them to make predictions.

05

FEATURE ENGINEERING

Select important features and construct more meaningful ones using the raw data that you have.

04

DATA EXPLORATION

Form hypotheses about the defined problem by visually analyzing the data.

HOW AIRBNB STARTED

BY ANNA VITAL

Or How 3 Guys Went From Renting Air Mattresses To A 10 Billion Dollar Company

A Message from Co-Founder and CEO Brian Chesky

By Airbnb · May 5, 2020 · [Company](#)

While these actions were necessary, it became clear that we would have to go further when we faced two hard truths:

- 1. We don't know exactly when travel will return.***
- 2. When travel does return, it will look different.***

The Economist ✓ @TheEconomist · 8m

The pandemic may be remembered not just as a health disaster, but as a geopolitical turning-point away from America

Is China winning?

The geopolitical consequences of covid-19 will be subtle, but unfortunate

The adaptive cycle

An infinity loop is a model for how destructive processes create spaces for new growth in both business and nature.

Source: Adapted from Lance Gunderson and C.S. Holling, *Panarchy: Understanding Transformations in Human and Natural Systems* (Island Press, 2001)

Panarchy Worksheet

Social, Mythical level

Policy

Region, Industry,
Sector

Unit, Organization,
Network, Community

Individuals, Group

Micro level

Panarchy example from an infection prevention project conducted in the US. Each dot represents a "current status" assessment by experts at that level. Note that both MRSA bacteria and the societal myth of inevitability can be framed with the same "lens."

Public Perception "Myth"
MRSA is an inevitable part of
modern healthcare (Rigidity Trap?)

Medicare Policy
shifting to non payment &
transparency for HAIs

Industry or Sector
Prevention Practices
still trying & wasting \$ to educate,
bribe or punish (Rigidity Trap?)

Hospital Beta Sites'
Prevention Practice
trying to invest more in spreading
safe practices to others (Poverty Trap?)

Individual Project Leader
stops over-controlling, unleashing more
unit-based self-organization

Community strain

Healthcare associated

MRSA Bacteria
is exploiting growth opportunities
in community & clinical settings

The idea is developed

An "established" innovation

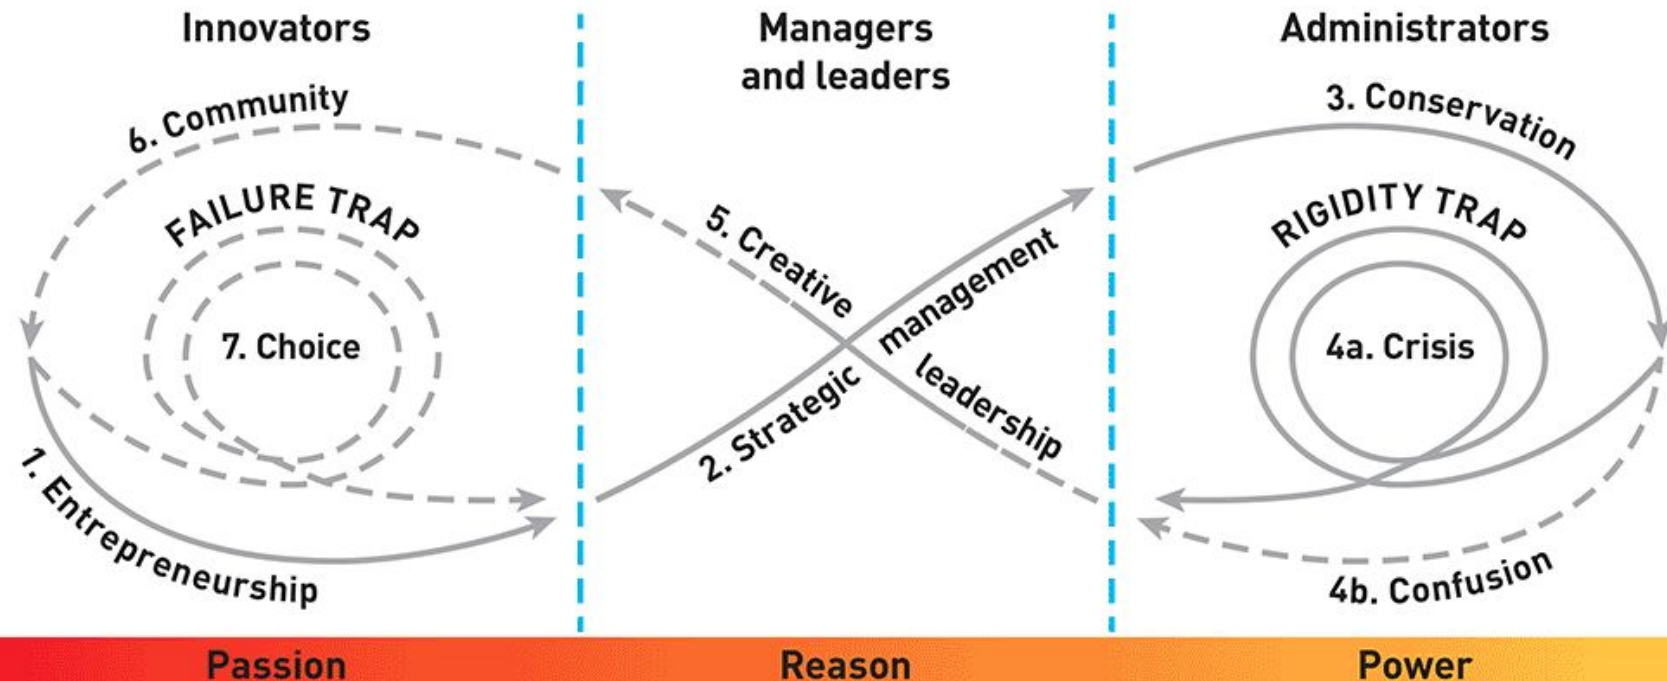

Adaptive Cycle

Adaptive cycles contain two major traps

Most companies won't make it all the way through an adaptive business cycle.

The solid lines represent the slow "front loop," and the dashed lines are the fast "back loop."

- 7) ¿ Qué podemos hacer ? 土着化 !!

What is Glocalization?

土着化 (どちゃくか) - dochakuka

Glocalization originated from Japanese business practices in the 1980s. Its literal translation was Dochakuka (土着化: melding global inside local). Glocalization, the blending and connecting of local and global contexts while maintaining differences and significant contribution of different cultural communities, serves to prevent learner assimilation in the host country (Kettaneh, 2016). It enriches learning and empowers learners since global issues are related and connected to local practice (Apple, Kenway, & Singh, 2005). By definition, the term glocal refers to those individuals, groups, divisions, units, organizations, and communities that are willing and able to “think globally and act locally” (Tien & Talley, 2012, p. 126). For the purpose of our research, Robertson’s (1995) definition of glocalization as “the simultaneity—the co-presence— of both universalizing and particularizing tendencies” (p. 30) was utilized. Hence, to implement the concept of “think globally, act locally,” educators and administrators should re-think their strategy relating to curriculum design and institutional policy. Educators and policy makers should permit construction of courses, pedagogy, and campus environments that enhance students’ retention, employability, and prepare them to become globally compatible citizens (Yang, 2001).

4.0 La nuova rivoluzione industriale

ore 17.30
23 novembre 2018

Presentazione del libro di Patrizio Bianchi
4.0 La nuova rivoluzione industriale
che ripercorre l'evoluzione dell'industria,
le sfide globali targate 4.0
e le nuove frontiere del mondo del lavoro.

Patrizio Bianchi è professore ordinario
di Economia applicata all'Università di Ferrara.

Trentino Sviluppo (Hall)

IMPRESA INNOVAZIONE MARKETING TERRITORIALE

In the 1990s by Etzkowitz (1993) and Etzkowitz and Leydesdorff (1995)

Illustrated the shift from a **dominating industry-government** dyad in the Industrial Society to a growing triadic **relationship** between **university-industry-government** in the Knowledge Society.

Triple Helix: **The potential for innovation and economic development in a Knowledge Society** lies in a more prominent role for the university and in the hybridisation of elements **from university, industry and government to generate new institutional and social formats** for the production, transfer and application of knowledge.

The University : Learning, Research, Innovation re-Stage
The Government : Policies, Taxes, etc.
The Industry : production / Services segment.

Triple Helix Systems of innovation

key features of Triple Helix

A set of components, relationships and functions. Among the components of Triple Helix Systems, a distinction is made between:

- A. R&D and non-R&D innovators.
- B. “Single-sphere” and “Multi-sphere” (hybrid) institutions.
- C. Individual and Institutional innovators.

The interactions into an 'innovation system' format,
Defined The relationships between components are
synthesized into;

Five main types:

1. Technology transfer
2. Collaboration and conflict moderation
3. Collaborative leadership
4. Substitution
5. Networking

Key Drivers of Digital Transformation

Source: Brian Solis, Altimeter Digital Transformation Survey, Q3 2018; Base: N=554

The infographic features a central circular graphic with the text "TRUST IN 5G". The circle is composed of two concentric rings, with the outer ring being orange and the inner ring being grey. Four colored dots (blue, green, red, and purple) are positioned around the circle, each connected by a white line to one of the four strategy boxes on the right. The strategy boxes are white with rounded corners and contain the strategy name, a brief description, and a numbered circle in a matching color.

TRUST IN 5G

EDUCATE

Fact Based education
Of all stakeholders. Talk to the facts

01

COLLABORATE

Collaboration with industry stakeholders
To manage and mitigate risk

02

INCENTIVISE

Appropriate Regulatory Policies
To incentivise implementation of Use Cases

03

THINK DIFFERENTLY

Mind-set Change
To enable Industry benefits to be realised
